WHAT IS CLAIMED IS:

- 1. A method of post processing an article formed by selective deposition modeling to remove a support structure, the article comprising a three-dimensional object and the support structure, the three-dimensional object formed from a curable phase change composition and the support structure formed from a non-curable phase change composition, the method comprising the following steps:
 - (a) providing a temperature controllable environment for the article having an initial temperature above the melting point of the non-curable phase change composition;
 - (b) placing the article in the temperature controllable environment;
 - (c) holding the temperature of the controllable environment above the melting point of the non-curable phase change composition until substantially all of the support structure transitions to a flowable state and is removed from the three-dimensional object;
 - (d) lowering the temperature of the controllable environment to a temperature just above the freezing point of the curable phase change composition;
 - (e) holding the temperature of the controllable environment just above the freezing point of the curable phase change composition until the temperature of all the regions of the three-dimensional object substantially equalize; and
 - (f) lowering the temperature of the three-dimensional object below the freezing point of the curable phase change composition at a rate wherein a temperature differential within the regions of the three-dimensional object does not exceed about 5°C.
- 2. The method of claim 1 wherein the temperature controllable environment includes at least one heat transferring medium.
 - 3. The method of claim 2 wherein the heat transferring medium is air.

- 4. The method of claim 2 wherein the heat transferring medium is a solid.
- 5. The method of claim 4 wherein the solid heat transferring medium comprises a plurality of particulate matter.
 - 6. The method of claim 2 wherein the heat transferring medium is a liquid.
- 7. The method of claim 6 wherein the liquid is an organic oil, a mineral oil, water, or the non-curable phase change composition in a flowable state.
- 8. The method of claim 2 wherein steps (a) (b) and (c) are completed in a heat transferring medium of air, and the steps (d) (e) and (f) are completed in a liquid heat transferring medium.
- 9. The method of claim 1 wherein the initial temperature of the controllable environment is between about 90° C to about 150° C.
- 10. The method of claim 1 wherein the initial temperature of the controllable environment is between about 120° C to about 125° C.
- 11. The method of claim 1 wherein the step of holding the temperature of the controllable environment above the melting point is accomplished for a time period of at least about 20 minutes.
- 12. The method of claim 1 wherein the step of lowering the temperature of the controllable environment to just above the freezing point is between about 75° C to about 65° C.

- 13. The method of claim 1 wherein the step of holding the temperature of the controllable environment just above the freezing point is accomplished for a time period of at least about 20 minutes.
- 14. The method of claim 1 wherein the step of lowering the temperature of the three-dimensional object below the freezing point is accomplished through a temperature range of between about 75° C to about 40° C.
- 15. The method of claim 1 wherein the step of lowering the temperature of the three-dimensional object below the freezing point is accomplished through a temperature range of between about 62° C to about 52° C for a period of time between about 5 minutes to about 10 minutes.
- 16. A method of post processing an article formed by selective deposition modeling, the article comprising a three-dimensional object and a support structure, the three-dimensional object formed from a curable phase change composition and the support structure formed from a non-curable phase change composition, the method comprising the following steps:
 - (a) providing a temperature controllable environment for the article having an initial temperature above the melting point of the non-curable phase change composition;
 - (b) placing the article in the temperature controllable environment;
 - (c) holding the temperature of the controllable environment above the melting point of the non-curable phase change composition until substantially all of the support structure transitions to a flowable state and is removed from the three-dimensional object;
 - (d) lowering the temperature of the controllable environment to a temperature just above the freezing point of the curable phase change composition;
 - (e) holding the temperature of the controllable environment just above the freezing point of the curable phase change composition until the temperature of all the regions of

the three-dimensional object substantially equalize; and

- (f) lowering the temperature of the three-dimensional object below the freezing point of the curable phase change composition at a rate wherein the temperature of the regions of the three-dimensional object remain substantially equal as the freezing point is crossed.
- 17. The method of claim 16 wherein the temperature controllable environment includes at least one heat transferring medium.
 - 18. The method of claim 17 wherein the heat transferring medium is air.
 - 19. The method of claim 17 wherein the heat transferring medium is a solid.
- 20. The method of claim 19 wherein the solid heat transferring medium comprises a plurality of particulate matter.
 - 21. The method of claim 17 wherein the heat transferring medium is a liquid.
- 22. The method of claim 17 wherein the liquid is an organic oil, a mineral oil, water, or the non-curable phase change composition in a flowable state.
- 23. The method of claim 16 wherein steps (a) (b) and (c) are completed in a heat transferring medium of air, and the steps (d) (e) and (f) are completed in a liquid heat transferring medium.
- 24. The method of claim 16 wherein the initial temperature of the controllable environment is between about 90° C to about 150° C.

- 25. The method of claim 16 wherein the initial temperature of the controllable environment is between about 120° C to about 125° C.
- 26. The method of claim 16 wherein the step of holding the temperature of the controllable environment above the melting point is accomplished for a time period of at least about 20 minutes.
- 27. The method of claim 16 wherein the step of lowering the temperature of the controllable environment to just above the freezing point is between about 75° C to about 65° C.
- 28. The method of claim 16 wherein the step of holding the temperature of the controllable environment just above the freezing point is accomplished for a time period of at least about 20 minutes.
- 29. The method of claim 16 wherein the step of lowering the temperature of the three-dimensional object below the freezing point is accomplished through a temperature range of between about 75° C to about 40° C.
- 30. The method of claim 16 wherein the step of lowering the temperature of the three-dimensional object below the freezing point is accomplished through a temperature range of between about 62° C to about 52° C for a period of time between about 5 minutes to about 10 minutes.
- 31. A method of post processing an article formed by selective deposition modeling to remove a support structure, the article comprising a three-dimensional object and the support structure, the three-dimensional object formed from a curable phase change composition and the support structure formed from a non-curable phase change composition, the method comprising

the following steps:

- (a) providing a temperature controllable environment for the article having an initial temperature above the melting point of the non-curable phase change composition;
- (b) placing the article in the temperature controllable environment;
- (c) removing substantially all of the support structure in a flowable state from the article;
- (d) lowering the temperature of the controllable environment to a temperature just above the freezing point of the curable phase change composition and allowing the temperature of all the regions of the three-dimensional object to substantially equalize;
- (e) lowering the temperature of the three-dimensional object below the freezing point of the curable phase change composition at a rate wherein a temperature differential within the regions of the three-dimensional object does not exceed about 5°C.
- 32. The method of claim 31 wherein the temperature controllable environment includes at least one heat transferring medium.
 - 33. The method of claim 32 wherein the heat transferring medium is air.
 - 34. The method of claim 32 wherein the heat transferring medium is a solid.
- 35. The method of claim 34 wherein the solid heat transferring medium comprises a plurality of particulate matter.
 - 36. The method of claim 32 wherein the heat transferring medium is a liquid.
- 37. The method of claim 36 wherein the liquid is an organic oil, a mineral oil, water, or the non-curable phase change composition in a flowable state.

- 38. The method of claim 32 wherein steps (a) (b) and (c) are completed in a heat transferring medium of air, and the steps (d) and (e) are completed in a liquid heat transferring medium.
- 39. The method of claim 31 wherein the step of lowering the temperature of the controllable environment to just above the freezing point is between about 75° C to about 65° C.
- 40. The method of claim 31 wherein the step of lowering the temperature of the three-dimensional object below the freezing point is accomplished through a temperature range of between about 75° C to about 40° C.
- 41. The method of claim 31 wherein the step of lowering the temperature of the three-dimensional object below the freezing point is accomplished through a temperature range of between about 62° C to about 52° C for a period of time between about 5 minutes to about 10 minutes.
